# SERIAL NUMBER INFORMATION

The serial numbers of all self-contained refrigerators and freezers is located inside the unit on the left hand panel near the top.

Always have the serial number of your unit available when calling for parts or service.

This manual covers standard units only. If you have a custom unit, consult the customer service department at the number listed on the last page.

# RECEIVING AND INSPECTING THE EQUIPMENT

Even though most equipment is shipped crated, care should be taken during unloading so the equipment is not damaged while being moved into the building.

- 1. Visually inspect the exterior of the package and skid or container. Any damage should be noted and reported to the delivering carrier immediately.
- 2. If damaged, open and inspect the contents with the carrier.
- 3. In the event that the exterior is not damaged, yet upon opening, there is concealed damage to the equipment, notify the carrier. Notification should be made verbally as well as in written form.
- 4. Request an inspection by the shipping company of the damaged equipment. This should be done within 10 days from receipt of the equipment.
- 5. Be certain to check the compressor compartment housing and visually inspect the refrigeration package. Be sure lines are secure and base is still intact.
- 6. Freight carriers can supply the necessary damage forms upon request.
- 7. Retain all crating material until an inspection has been made or waived.

# INSTALLATION

## Location

Units represented in this manual are intended for indoor use only. Be sure the location chosen has a floor strong enough to support the total weight of the cabinet and contents. A fully loaded unit can weigh as much as 1500 pounds. Reinforce the floor as necessary to provide for maximum loading. For the most efficient refrigeration, be sure to provide good air circulation inside and out.

#### Inside cabinet

Do not pack the units so full that air cannot circulate. The refrigerated air is discharged at the top rear of the unit. It is important to allow for proper air flow from the top rear to the bottom of the unit. Obstructions to this air flow can cause evaporator coil freeze ups and loss of temperature or overflow of water from the evaporator drain pan. The shelves have a rear turn up on them to prevent this. However, bags and other items can still be located to the far rear of the cabinet. Air is brought into the evaporator coil with fans. Prevent obstruction by locating large boxes and tall stacks of product to the outlet or inlet of air flow.

#### **Outside cabinet**

Be sure that the unit has access to ample air. Avoid hot corners and locations near stoves and ovens. It is recommended that the unit be installed no closer than 2" from any wall

#### Leveling

A level cabinet looks better and will perform better because the doors will line up with the frames properly; the cabinet will not be subject to undue strain and the contents of the cabinet will not move around on the shelves. Use a level to make sure the unit is level from front to back and side to side. Units supplied with legs will have adjustable bullet feet to make the necessary adjustments. If the unit is supplied with casters, no adjustments are available. Ensure the floor where the unit is to be located is level.

### **Stabilizing**

All models are supplied with casters for your convenience, ease of cleaning underneath and for mobility. It is very important, however, that the cabinet be installed in a stable condition with the front wheels locked while in

Should it become necessary to lay the unit on its side or back for any reason, allow at least 24 hours before start-up so as to allow compressor oil to flow back to the sump. Failure to meet this requirement can cause compressor failure and unit damage.

Unit repairs will not be subject to standard unit warranties due to improper installation procedures.

#### **Electrical connection**

Refer to the amperage data on page 3, the serial tag, your local code or the National Electrical Code to be sure the unit is connected to the proper power source. A protected circuit of the correct voltage and amperage must be run for connection of the line cord or permanent connection to the unit.

The ON/OFF switch must be turned to OFF and the unit disconnected from the power source whenever performing service, maintenance functions or cleaning the refrigerated area.

## **OPERATION**

Do not throw items into the storage area. Failure to heed these recommendations could result in damage to the interior of the cabinet.

#### Refrigerated cabinets

Temperature range for the internal cabinets is 28° F to 50° F for all food prep, undercounter and worktop refrigerator units; and -11° F to -1° F for undercounter and worktop freezers.

Food Prep units should operate with pans in place. Operating without pans and/or pan covers in place will decrease the efficiency and may damage the unit due to continuous running.

Continuous opening and closing of the door will prevent the unit's ability to maintain optimum refrigeration temperature.

Top section is not intended for overnight storage. Product should be removed from pans. Pans can remain in cabinet while empty.

### **Defrosting:**

Every 6 hours, the unit will turn off to let the ice on the evaporator coil clear up. The control will display the defrost symbol. When the coil temperature reaches the terminal temperature or after 20 minutes (whichever comes first), the unit will turn on again.

#### On/Off Switch:

An on/off switch is located on the front of the bottom panel and on the condenser compartment door for the Pizza prep tables. When the unit is on, the switch will glow green.

#### SOLID-STATE THERMOSTAT DESCRIPTIONS

#### 1. FRONT PANEL COMMANDS

- **SET**: To display target set point. In programming mode, select a parameter or confirm an operation.
- (DEF) To start a manual defrost
- To see the last temperature alarm occurrence. In programming mode, it browses the parameter codes or increases the display value
- **▼ (DOWN)** To see the last temperature alarm occurrence. In programming mode, it browses the parameter codes or decreases the display value

#### **KEY COMBINATION**

★ + ▼ To lock & unlock the keyboard

**SET + ▼** To enter in programming mode

**SET +** A To return to the room temperature display

#### 1.1 Function of LEDS

LED	MODE	FUNCTION				
**	ON	Compressor enabled				
	Flashing	-Programming Phase (flashing with 🛣) - Anti-short cycle delay enabled				
療物	ON	Defrost enabled				
懋	Flashing	- Programming Phase (flashing with 🕸) - Drip time in progress				
*	ON	Fans enabled				
÷	Flashing	Fans delay after defrost in progress.				
	ON	A temperature alarm occurred				

#### 2. MAIN FUNCTIONS

#### 2.1 HOW TO VIEW THE SET POINT

## 2.2 HOW TO CHANGE THE SET POINT

- 1. Push the **SET** key for more than 2 seconds to change the set point value.
- 2. The value of the set point will be displayed and the \*\* LED starts blinking.
- 3. To change the set value, push the or key within 10s.
- 4. To set a new point value, push the SET key again or wait 10s.

#### 2.3 HOW TO START A MANUAL DEFROST

Push the \* key for more than 2 seconds and a manual defrost will start

# 2.4 HOW TO LOCK THE KEYBOARD

1. Keep pressed the A and keys for more than 3s.

3. If a key is pressed more than 3s, the "POF" message will be displayed.

#### 2.5 HOW TO UNLOCK THE KEYBOARD

Keep pressed the A and keys together for more than 3s until the "Pon" message is displayed.

#### 3. ALARM SIGNALS

#### HOW TO VIEW THE ALARM AND RESET THE RECORDED ALARM

- 1. Push the A or key to display the alarm signals.
- 2. When the signal is displayed, hold the **SET** key until the "rst" message is displayed, and push the **SET** key again. The "rst" message will start blinking and the normal temperature will be displayed again.

Message	Cause	Outputs		
"P1"	Room probe failure	Compressor output according to par. "Con" and "COF"		
"P2"	Evaporator probe failure	Defrost end is timed.		
" P3"	Condenser probe failure	Outputs unchanged.		
"HA"	Maximum temperature alarm	Outputs unchanged.		
"LA"	Minimum temperature alarm	Outputs unchanged.		
"dA"	Door open	Compressor and fans restart.		
"EA"	External alarm	Output unchanged.		
"CA"	Serious external alarm (i1F=bAL)	All outputs OFF.		
" CSd"	Condenser alarm	All outputs OFF.		

## MAINTENANCE

The power switch must be turned to OFF and the unit disconnected from the power source whenever performing service, maintenance functions or cleaning the refrigerated area.

#### Refrigerated cabinets

The interior and exterior can be cleaned using soap and warm water. If this is not sufficient, try ammonia and water or a nonabrasive liquid cleaner. When cleaning the exterior, always rub with the "grain" of the stainless steel to avoid marring the finish.

Do not use an abrasive cleaner because it will scratch the stainless steel and plastic and can damage the breaker strips and gaskets.

### **Cleaning the Condenser Coil**

The condenser coil requires regular cleaning and the recommendation is every 90 days. In some instances, you may find that there is a large amount of debris and dust or grease accumulated prior to the time frame of 90 days. In these cases the condenser coil should be cleaned every 30 days.

If the build-up on the coil consists of only light dust and debris, the condenser coil can be cleaned with a simple brush. Heavier dust build-up may require a vacuum or even compressed air to blow through the condenser coil.

If heavy grease is present, there are de-greasing agents available for refrigeration use and specifically for the condenser coils. The condenser coil may require a spray with the de-greasing agent and then blown through with compressed air.

Failure to maintain a clean condenser coil can initially cause high temperatures and excessive run times. Continuous operation with dirty or clogged condenser coils can result in compressor failures. Neglecting the condenser coil cleaning procedures will void any warranties associated with the compressor or cost to replace the compressor.

Never use a high- pressure water wash for this cleaning procedure as water can damage the electrical components located near or at the condenser coil.

In order to maintain proper refrigeration performance, the condenser fins must be cleaned of dust, dirt and grease regularly. It is recommended that this be done at least every three months. If conditions are such that the condenser is totally blocked in three months, the frequency of cleaning should be increased. Clean the condenser with a vacuum cleaner or stiff brush. If extremely dirty, a commercially available condenser cleaner may be required.

## Stainless Steel Care and Cleaning

To prevent discoloration of rust on stainless steel, there are several important steps to be taken. First, we need to understand the properties of stainless steel. Stainless steel contains 70-80% iron which will rust. It also contains 12-30% chromium which forms an invisible passive film over the steel's surface which acts as a shield against corrosion. As long as the protective layer is intact, the metal is still stainless. If the film is broken or contaminated, outside elements can begin to breakdown the steel and begin to form rust of discoloration.

Proper cleaning of stainless steel requires soft cloths or plastic scouring pads.

**NEVER USE STEEL PADS, WIRE BRUSHES OR SCRAPERS!** 

# **MAINTENANCE**

Cleaning solutions need to be alkaline based or non-chloride cleaners. Any cleaner containing chlorides will damage the protective film of the stainless steel. Chlorides are also commonly found in hard water, salts, and household and industrial cleaners. If cleaners containing chlorides are used, be sure to rinse repeatedly and dry thoroughly upon completion.

Routine cleaning of stainless steel can be done with soap and water. Extreme stains or grease should be cleaned with a non-abrasive cleaner and plastic scrub pad. It is always good to rub with the grain of the steel. There are also stainless steel cleaners available which can restore and preserve the finish of the steels protective layer.

Early signs of stainless steel breakdown can consist of small pits and cracks. If this has begun, clean thoroughly and start to apply stainless steel cleaners in attempt to restore the passivity of the steel.

Never use an acid based cleaning solution! Many food products have an acidic content which can deteriorate the finish. Be sure to clean the stainless steel surfaces of ALL food products. Common acidic items include tomatoes, peppers and other vegetables.

#### **Gasket Maintenance**

Gaskets require regular cleaning to prevent mold and mildew build up and also to keep the elasticity of the gasket. Gasket cleaning can be done with the use of warm soapy water. Avoid full strength cleaning products on gaskets as this can cause them to become brittle and prevent proper seals. Also, never use sharp tools or knives to scrape or clean the gasket which could possibly tear the gasket and rip the bellows.

Gaskets can easily be replaced and don't require the use of tools or authorized service persons. The gaskets are "Dart" style and can be pulled out of the groove in the door and new gaskets can be "pressed" back into place.

#### **Doors/Hinges**

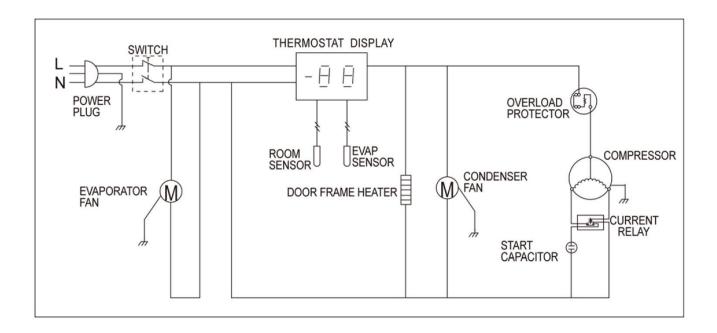

Over time and with heavy-use doors, the hinges may become loose. If it is noticed that the door is beginning to sag, it may become necessary to tighten the screws that mount the hinge brackets to the frame of the unit. If the doors are loose or sagging, this can cause the hinge to pull out of the frame which may damage both the doors and the door hinges. In some cases, this can require qualified service agents or maintenance personnel.

#### **Drain Maintenance**

Each unit has a drain located inside the unit which removes the condensation from the evaporator coil and evaporates it into an external condensate evaporator pan. Each drain can become loose or disconnected from moving or bumping the drain. If you notice excessive water accumulation on the inside of the unit, be sure the drain tube is connected from the evaporator housing to the condensate evaporator drain pan. If water is collected underneath the unit, you may want to check the condensate evaporator drain tube to be sure it is still located inside the drain pan. The leveling of the unit is important as the units are designed to drain properly on a level surface. If your floor is not level, this can also cause drain problems. Be sure all drain lines are free of obstructions. Typically, food product is found blocking drain lines causing water to back up and overflow the drain pans.
